

The Hsp60/10 client decline is associated with both tau and amyloid pathology

D/amyloid were modeled separately. Positive pathology-aligned beta indicates lower protein abundance with worse pathology.

A. Pathology-aligned protein association in late-stage AD clients

Positive beta indicates lower protein abundance with worse pathology.

Late-decline group ● Top-quartile late decline ● Other clients

C. Late-stage decline is associated with CERAD/amyloid-aligned protein

Because lower CERAD scores indicate worse pathology, positive beta is the pathology-aligned decline
