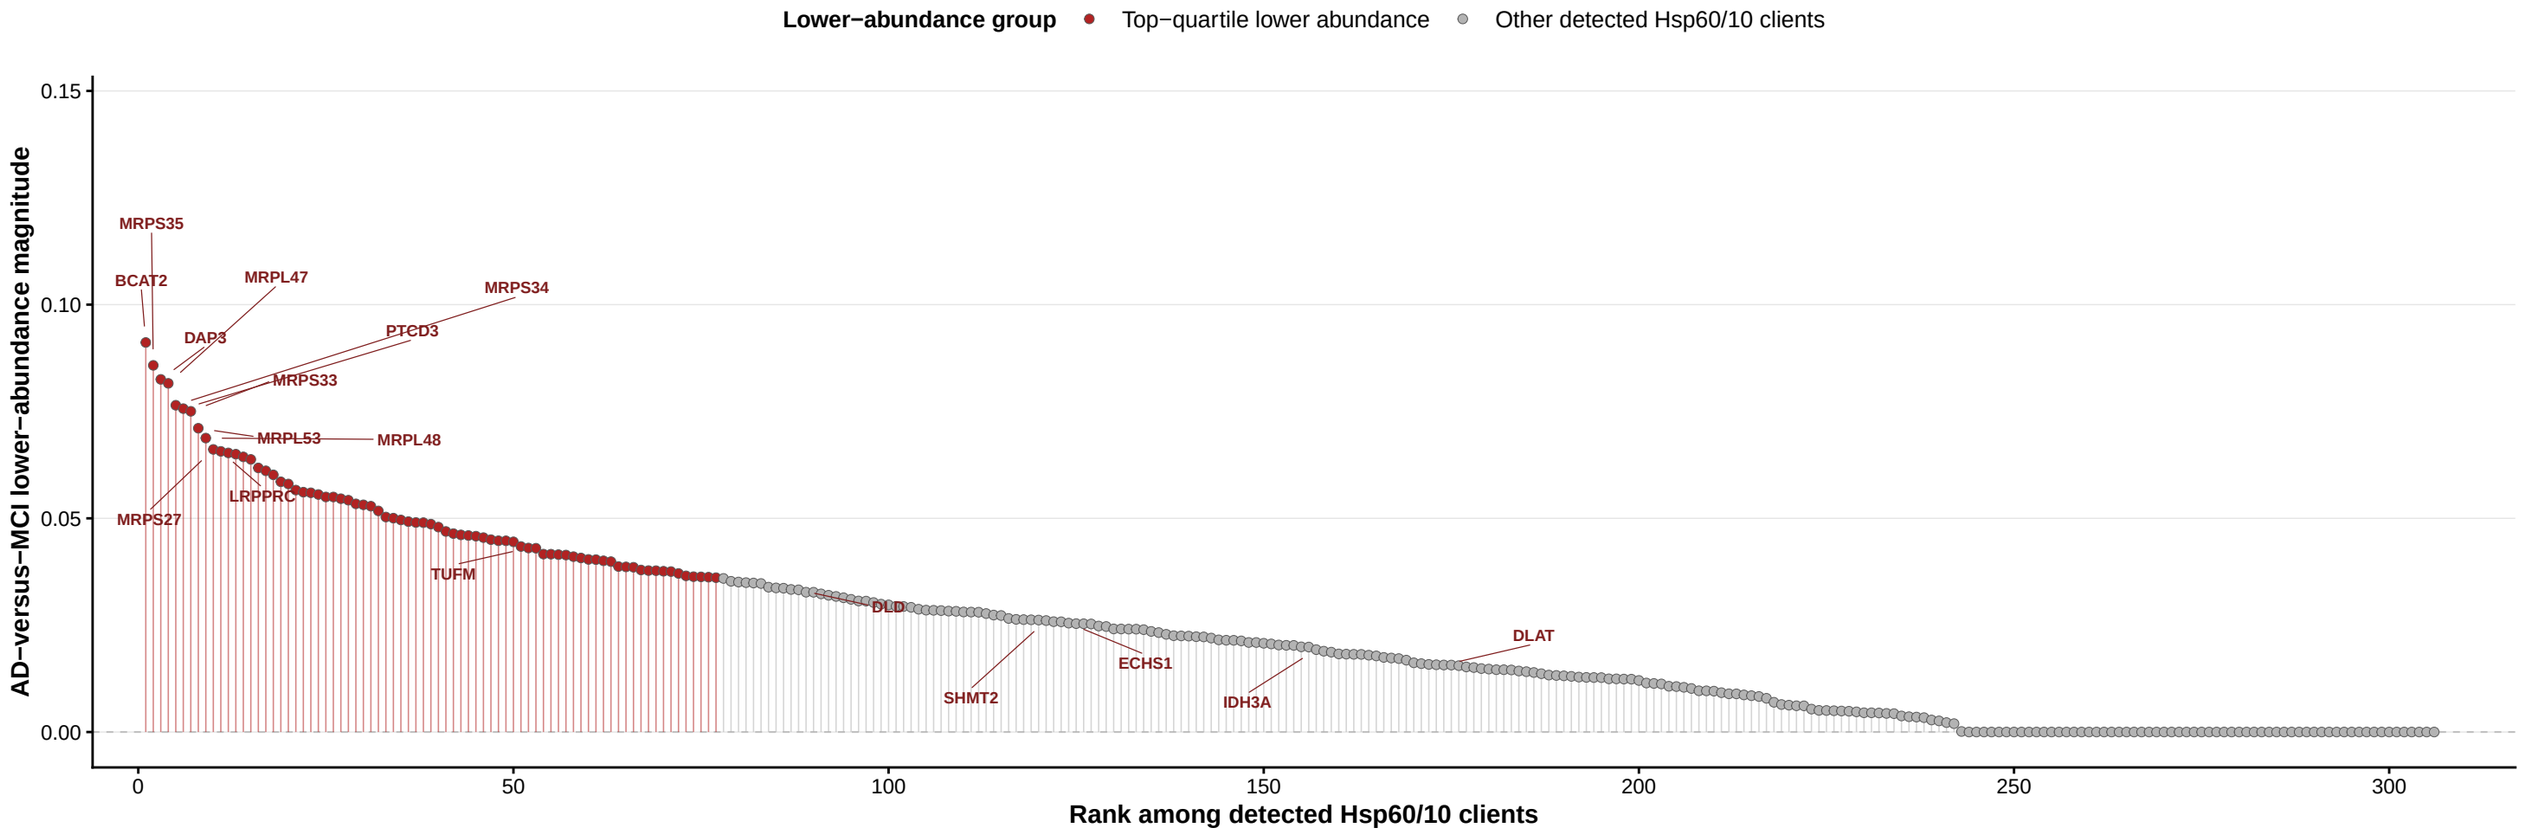
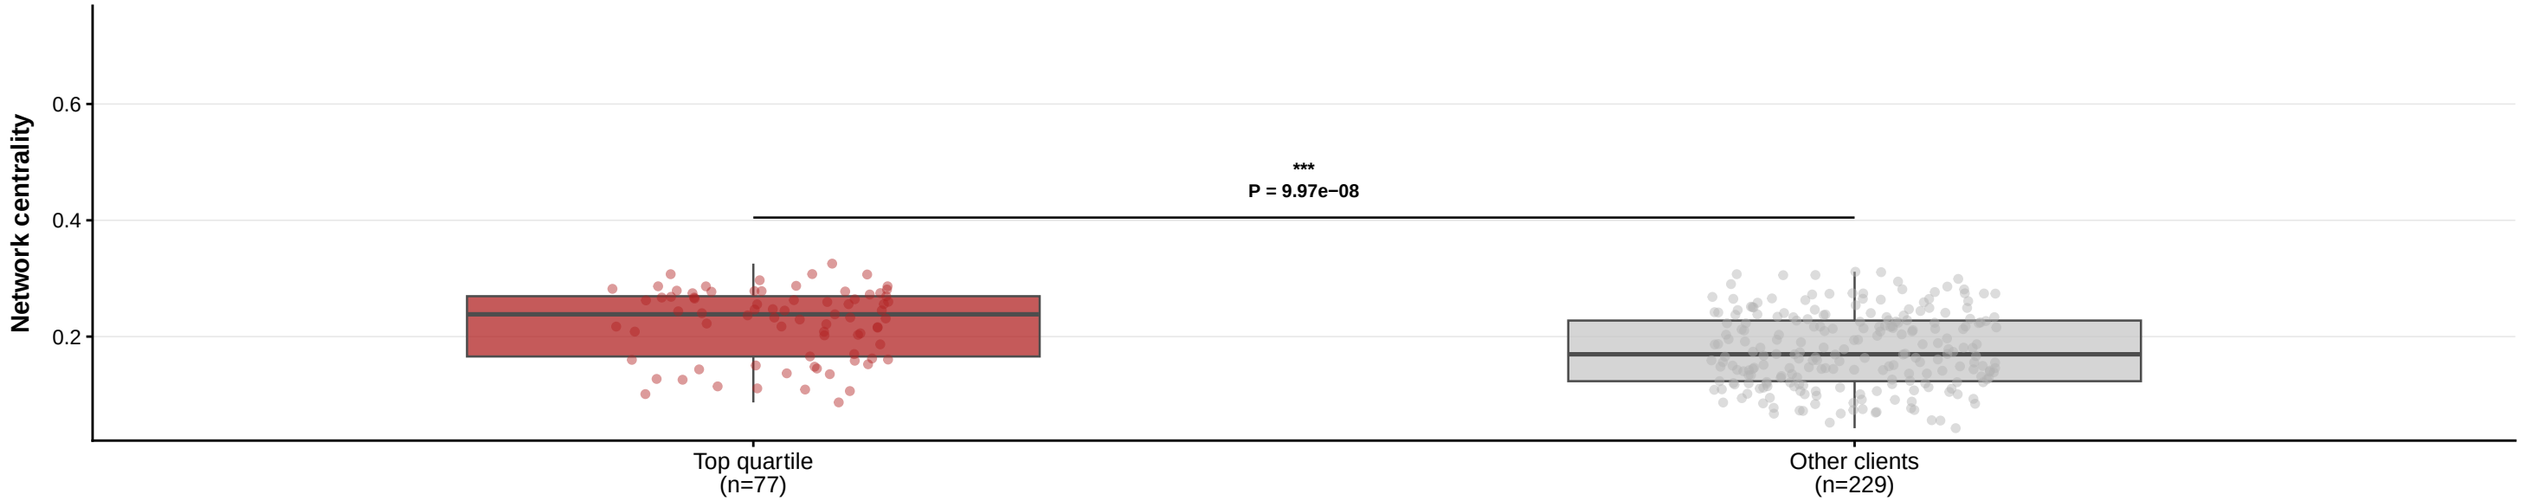
# Hsp60/10 client vulnerability is selective across the full client network

AD−versus−MCI lower−abundance magnitude is heterogeneous; clients with the greatest lower−abundance magnitude show greater network centrality.

## A. AD−versus−MCI lower abundance is heterogeneous across the Hsp60/10 client network

All detected Hsp60/10 clients are ranked by AD−versus−MCI lower−abundance magnitude; red marks the top quartile.



## B. Network centrality


Top−quartile lower−abundance clients occupy more central positions in the client network.
