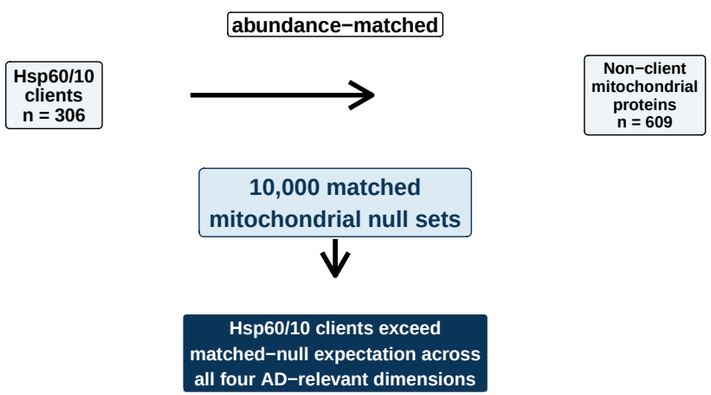
Hsp60/10 clients show coordinated vulnerability across AD−relevant dimensions

Against 10,000 abundance−matched non−client mitochondrial null sets, Hsp60/10 clients show stronger AD−versus−MCI lower−abundance magnitude, stronger joint Braak/CERAD pathology association, h

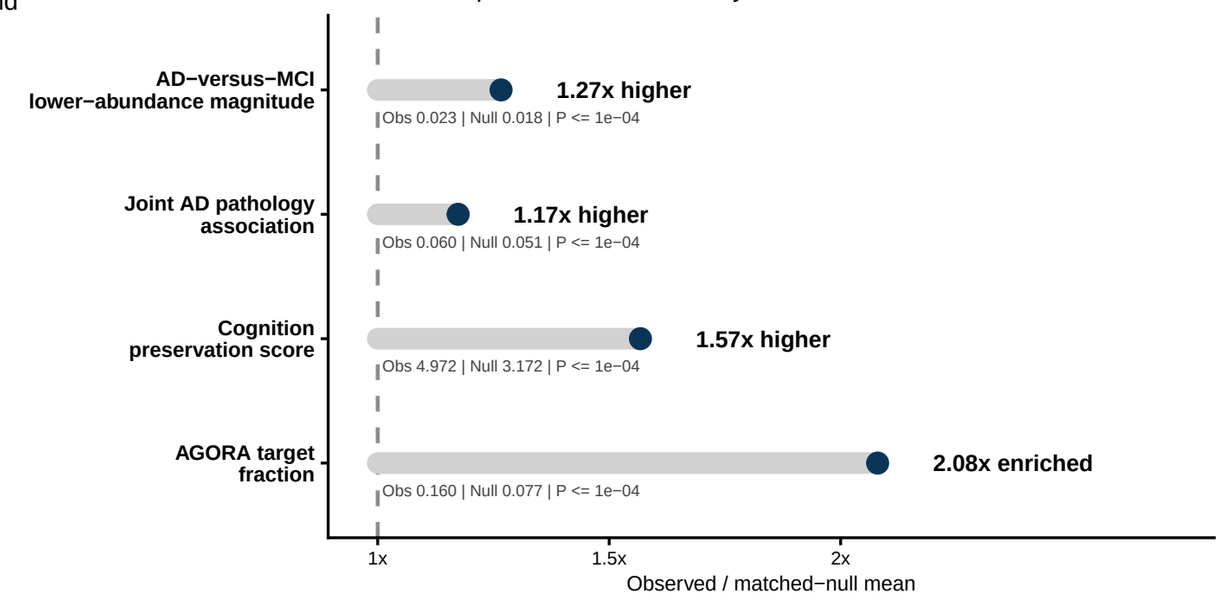
A. Matched mitochondrial specificity test

Comparing Hsp60/10 clients against abundance−matched non−client mitochondrial background



B. Enrichment over matched−null expectation

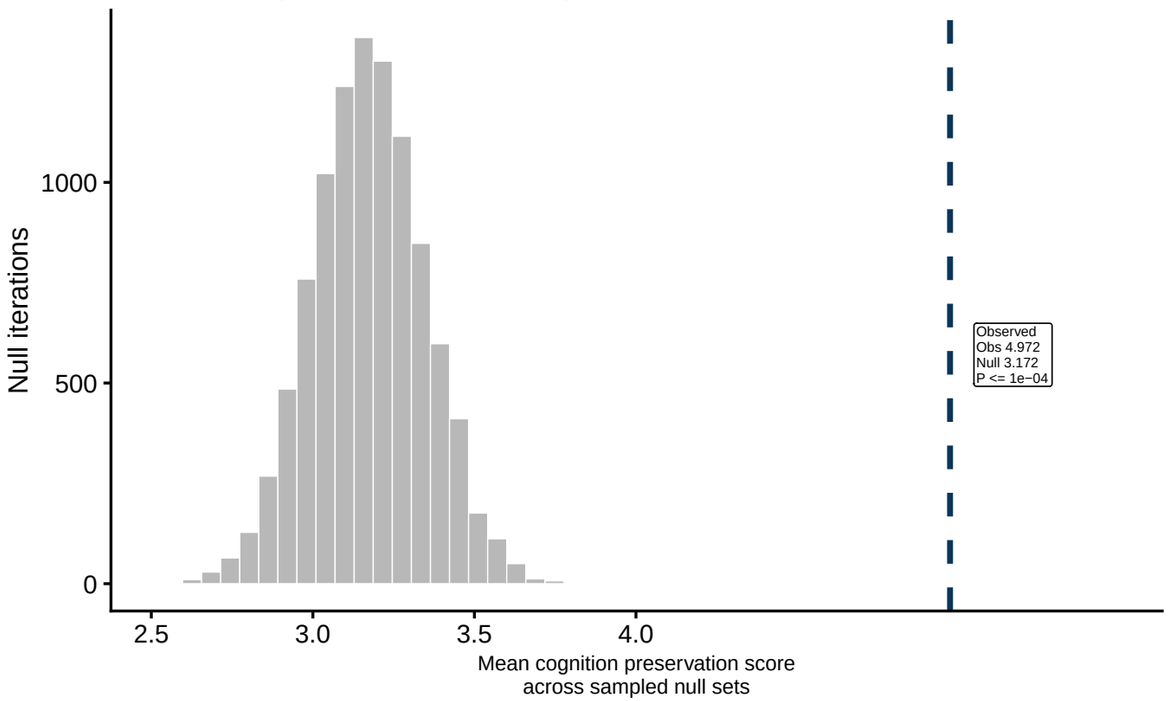
Observed Hsp60/10 mean divided by the matched mitochondrial null mean



Dashed line = no enrichment (1.0x).

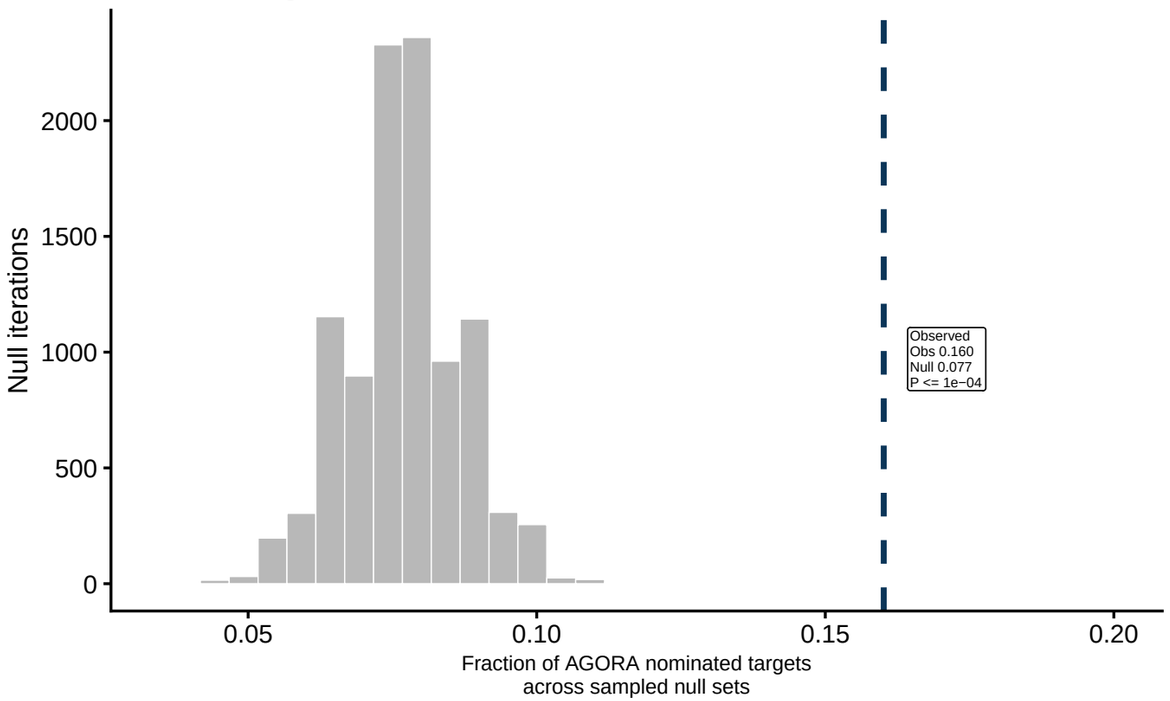
C. Cognition preservation exceeds the matched−null distribution

Client−level cognition association ranking



D. AGORA target enrichment exceeds the matched−null distribution

External AD target nomination enrichment



Matched background = detected non−Hsp60/10 mitochondrial proteins. Bottom panels: dashed blue line marks the observed Hsp60/10 client mean. Empirical p−values are bounded by 10,000 null iterations.
